Summary

- Consistent Decay Across Cohorts**
 - All cohorts show a gradual drop in retained users week by week
 - No sudden drops or spikes — which suggests stable product behavior
- Week 1 Dip**
 - Across all cohorts, the biggest retention drop happens between **Week 0 and Week 1**.
 - This confirms Week 1 as the key activation window — where onboarding, value delivery, and engagement must peak.
- December 14 Cohort: Early Drop, Late Recovery**
 - Starts with 24,839 users, drops to 23,013 by Week 6 → **92.65% retention**.
 - Despite a sharper early churn (Week 1–3), it stabilizes well — possibly due to holiday engagement or delayed onboarding.
- Best-Performing Cohort**
 - Dec 21 cohort** retains 94.18% by Week 5 — the strongest long-term retention.
 - Could indicate that users acquired pre-holiday were more committed or better targeted.
- Holiday vs. Post-Holiday Behavior**
 - Holiday cohorts (Dec 21, Dec 28) may include users with more time to explore the product.
 - January cohorts might reflect post-holiday fatigue or less engaged traffic.
- January Cohorts: Incomplete but Promising**
 - January 4 cohort reaches **92.60% by Week 3**, with data missing for Weeks 4–6.
- Retention Stability**
 - Retention rates across cohorts are **consistently high**, starting near 100% and gently declining to ~92–94% by Week 5.
 - No sharp drop-offs — which implies solid onboarding and early engagement.
